# **EXPERIMENT-3**

## AIM:

Estimate the accuracy of decision classifier on breast cancer dataset using 5 fold cross validation.

## **ALGORITHM:**

- 1. Select the best attribute using Attribute Selection Measures (ASM) to split the records.
- 2. Make that attribute a decision node and breaks the dataset into smaller subsets.
- 3. Starts tree building by repeating this process recursively for each child until one of the conditions will match:
  - a. All the tuples belong to the same attribute value.
  - b. There are no more remaining attributes.
  - c. There are no more instances.
